## Track Management for Multiple Tracks
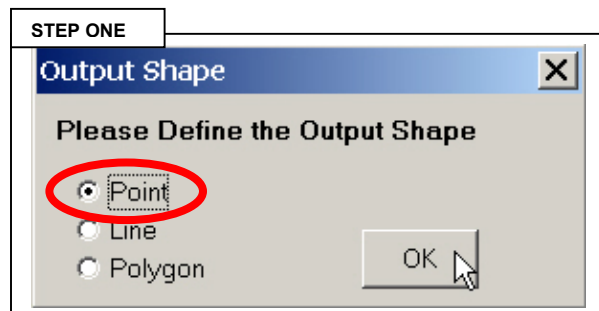

Multiple Tracks collected in Active Track.
Fill / Off used to stop and start new Tracks.

Save As | ArcView Shapefile,
Output Shape | Polygon

The Problem

Solution

DNR Garmin makes a Polygon out of each Track segment

STEP ONE

Instead choose:
Save As | ArcView Shapefile,
**Output Shape | Point**

Track displays as **points** in the View.

STEP TWO

Exit the DNR Garmin Window.
**File | Exit**

STEP THREE

Use the **Select Tool** to select the points that make up the "polygon" feature.
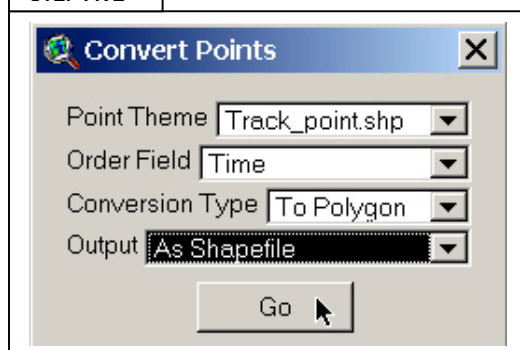

STEP FOUR

In the <u>drop down menu</u> choose:
DNR Garmin | Convert Points

Selected Points in Yellow

Convert Points window pops open
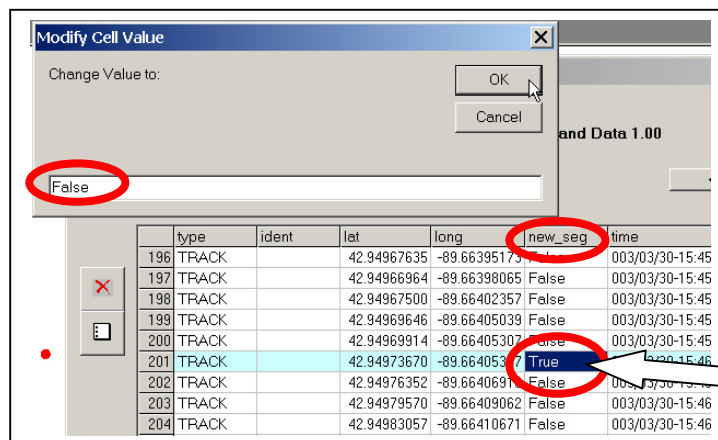

STEP FIVE

Order Field | **Time**
Conversion Type | **To Polygon**
Output | **As Shapefile**

No Problem!

Result: Polygon created from selected points

Another Method...

Double Click in Cell to Modify

Note: Another method is to edit the track table to eliminate new track segment designations.
         The track point that begins a new track segment has blue fill and "new_seg" field equals "True."
         First blue row is required to begin the polygon so <u>do not</u> edit initial blue row that begins the track!

- Scroll down to the next (second) blue row in table that follows the initial blue row
- Double click in "True" cell in the "new_seg" column
- Change Value to "False"
- Continue to change blue rows as needed to complete continuous track designation
- Save as | ArcView Shapefile
- Output | Polygon
